

Contoso Financial Service HR Onboarding Assistant

Full Scenario Brief & Data Ingestion Boundaries

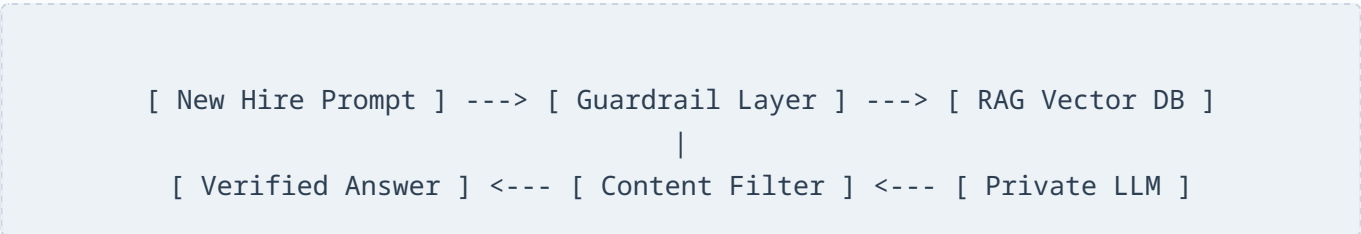

Status:	Synthetic Data Ingestion Boundaries Approved	Version:	v1.2-Pilot
System Name:	Contoso Financial Service HR Onboarding Assistant	Target Deployment:	Internal HR Portal (Contoso Financial Service Enterprise)

1. Executive Summary & Purpose

The Contoso Financial Service Onboarding Assistant is a generative AI-powered conversational interface and workflow automation agent designed to streamline the transition experience for incoming employees at Contoso Financial Service. By providing instant, 24/7 access to organizational knowledge, corporate policies, IT provisioning workflows, and comprehensive health/benefit summaries, the platform target is to reduce HR ticket volume by **40%** during peak high-volume hiring cycles.

2. Technical Architecture & Data Ingestion

The platform relies on a Retrieval-Augmented Generation (RAG) framework implemented on top of a foundational Large Language Model (LLM) hosted securely within a private corporate cloud tenant. This ensures enterprise data isolation and rigorous access control frameworks.

A. Ingestion Scope (The "Safe Zone")

Only verified, synthetic, and non-sensitive knowledge assets are indexed within the production RAG vector database:

- Contoso Financial Service Employee Handbooks (v2025, v2026 editions).
- IT Asset Allocation Guidelines, Standard Operating Procedures, and Ticket Wikis.
- Health, Dental, and Vision Benefit Summaries (Synthetic packages designated as *Alpha*, *Beta*, and *Delta*).

B. Data Boundaries (Strictly Out of Scope / Excluded)

To prevent data leakage and privacy non-compliance, the following assets are strictly banned from ingestion:

- Live Personally Identifiable Information (PII) of any active, legacy, or candidate employee profiles.

- Corporate financial disclosures, market strategies, or unreleased product/business roadmaps.
- Individual compensation figures, bonuses, performance reviews, or custom employment contract negotiation texts.

3. Core Operational Capabilities

- **Query Resolution:** Contextual dialogue parsing to correctly address user inquiries such as *"How do I sign up for the Delta dental plan?"* or *"What is the standard policy for remote work stipends?"*
- **Workflow Triggering:** Downstream integration hooks that programmatically draft and dispatch IT service tickets for hardware allocation (e.g., automated laptop delivery configurations) matching confirmed user choices.

Operating Notice: This brief establishes a strict perimeter around system intelligence. No automated capability or retrieval mechanism shall operate outside the designated synthetic data ingestion boundaries.
